- 1. A network interface apparatus for preventing access to a sensitive network, comprising:
- a first interface, with a transmit and a receive port, for receiving
  data from a sensitive network and for transmitting signals to said sensitive
  network;
- a second interface, with a transmit port, for transmitting said data to a remote network;
- an optical signal generator wherein a signal is transmitted from said first interface to said sensitive network.
  - 2. A network isolation device comprising:
  - a first media converter for receiving data from a workstation; a second media converter for receiving data from said first media converter, and transmitting said data to a remote computer;
  - an optical signal generator, wherein said optical signal generator sends signals to said workstation to imitate a standard transmit and receive connection, and said signal generator sends signals to said second media converter to imitate a standard transmit and receive connection, whereby no physical connection exists that said remote computer can send any signals to said workstation.
  - 3. A network isolation device as in claim 2, wherein said first media converter, said second media converter and said optical signal generator are in a common housing.
  - 4. A network isolation device as in claim 3, wherein said workstation is operatively connected to a network of data acquisition units.
  - 5. A network isolation device as in claim 4, wherein said remote computer is operatively connected to a network.
    - 6. A system for isolating one network from a second network comprising:

Navy Case No. 84,3	96
--------------------	----

## 301-227-1835

396	a	first	network;

a second network;

an isolation box, operatively connected between said first and said second network, including a first media converter, a second media converter and a signal generator, wherein said signal generator sends signals to switches on said first network and said second media converter whereby said switches appear fully connected.
